

## The mHealth Compendium Series

The African Strategies for Health (ASH) project has produced six volumes of the mHealth Compendium containing 167 profiles of mobile health (mHealth) programs. The volumes document key mHealth resources, and describe featured programs and their results, lessons learned, and implementation challenges.

The mHealth programs featured in the series have focused on implementations in Africa, and include select programs in 14 countries around the world.

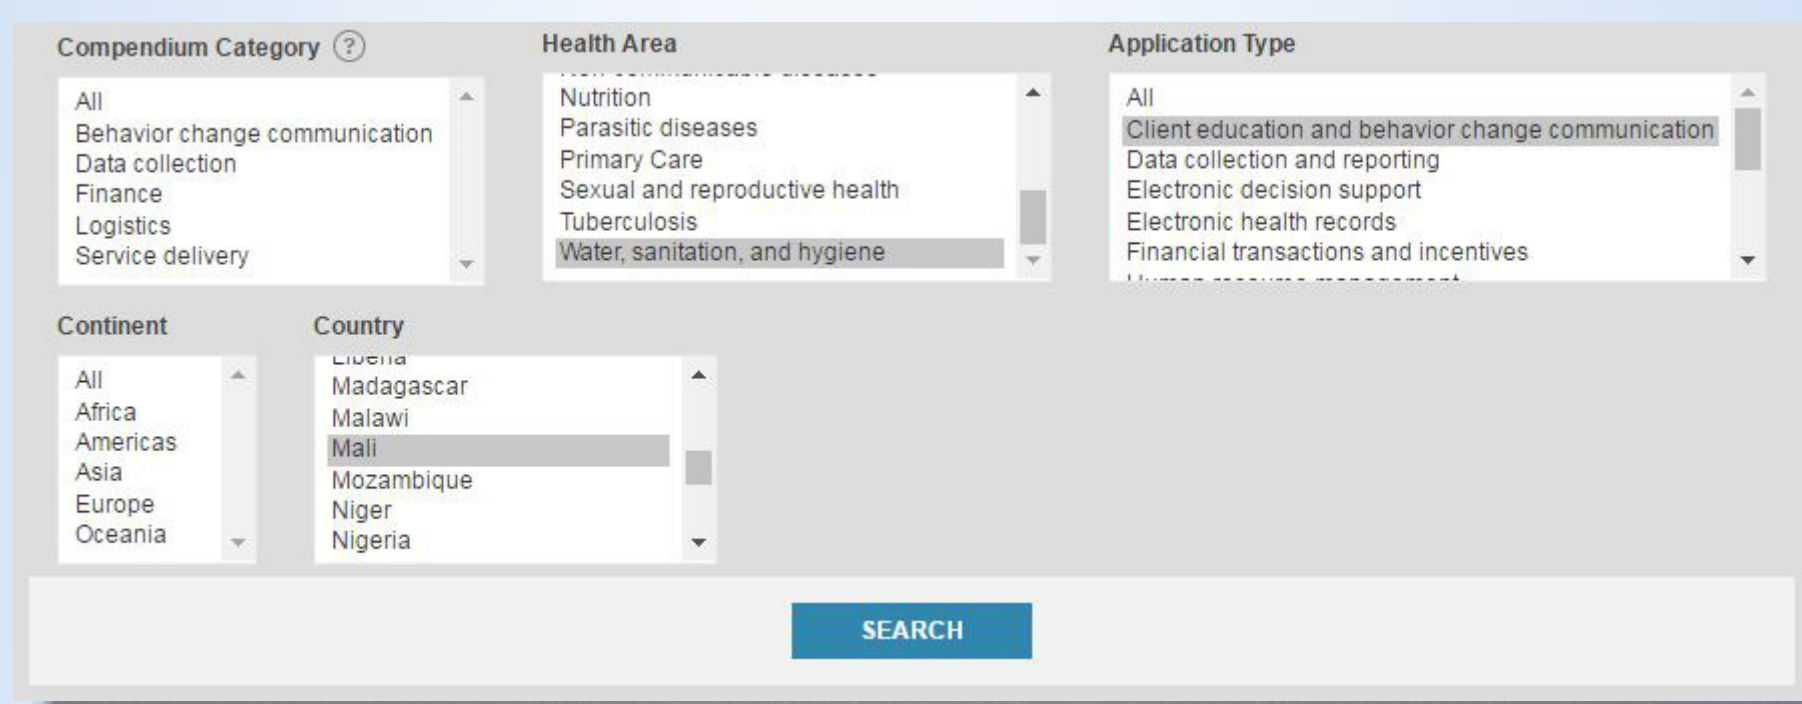

### Spotlight on the Special Edition

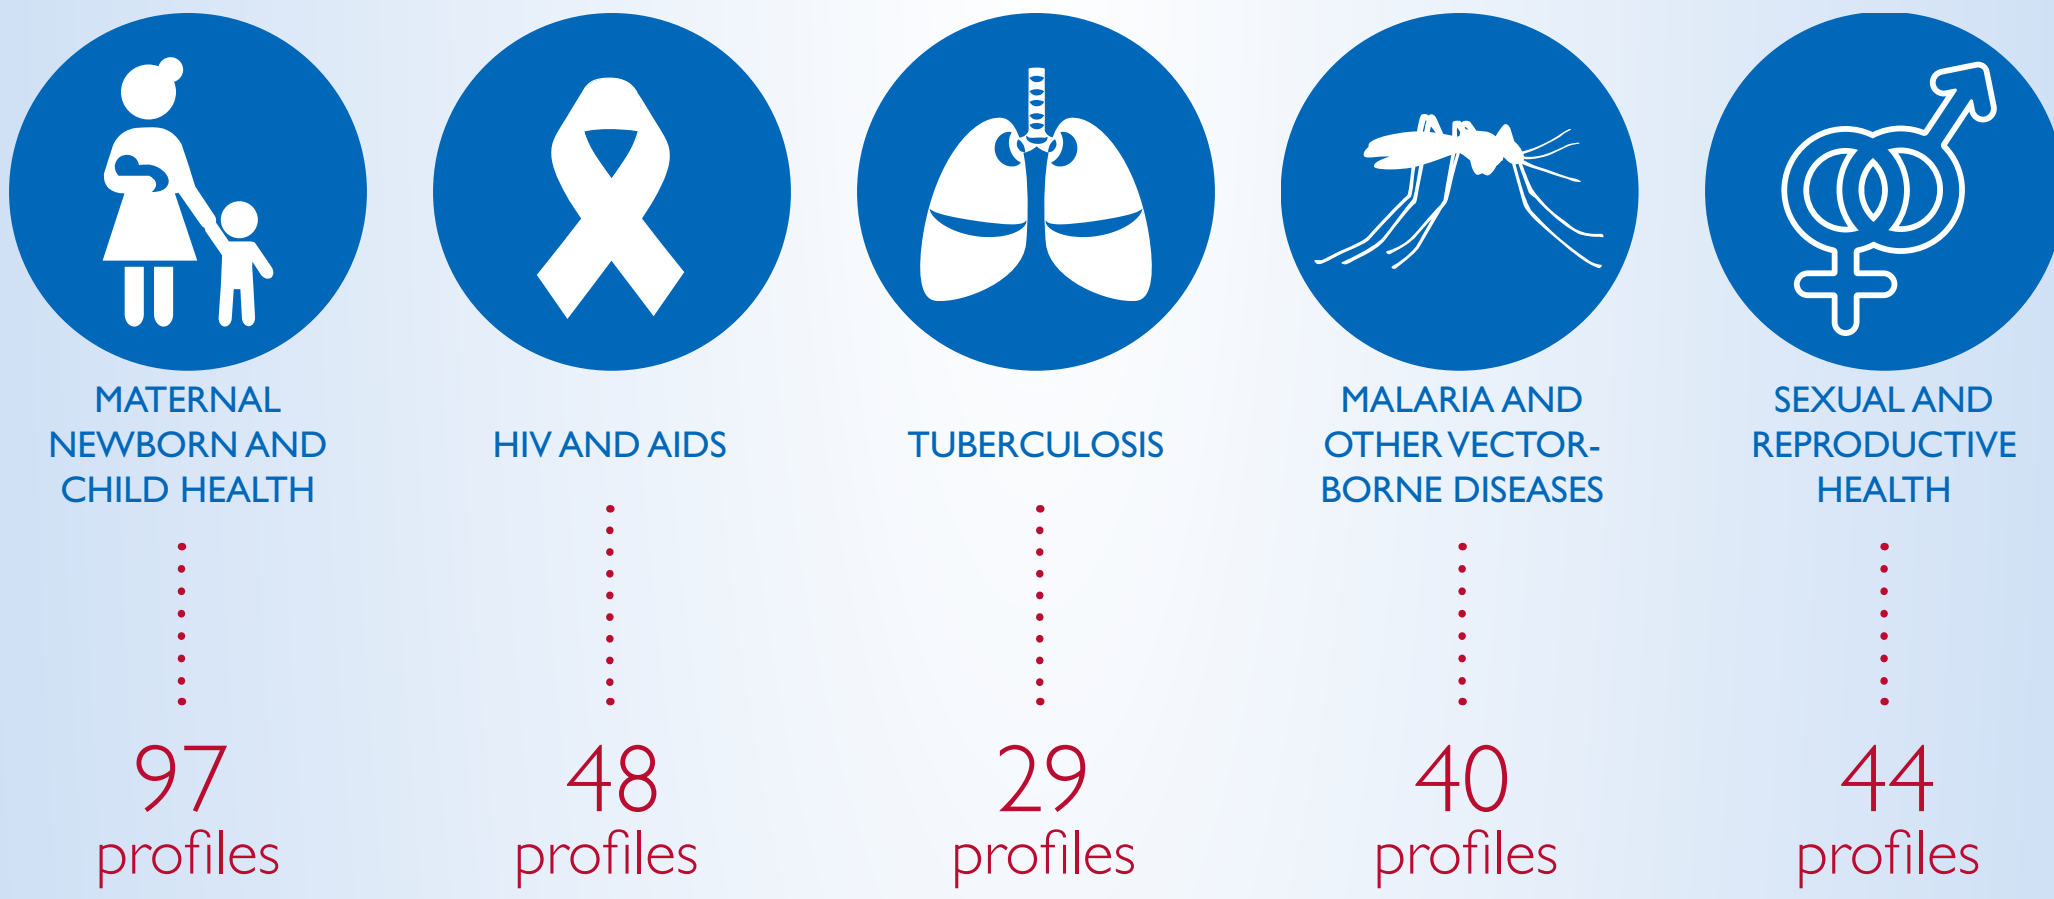

SPECIAL EDITION

As the mHealth landscape has evolved, more programs and countries look to establish scaled, sustainable interventions utilizing digital technology, and the need for detailed learning from mHealth programs which have successfully grown has increased. While many of the pilot interventions featured in the series volumes have since phased out, some scaled up. Ten scaled mHealth programs are presented with in-depth profiles in the Special Edition 2016: Reaching Scale.

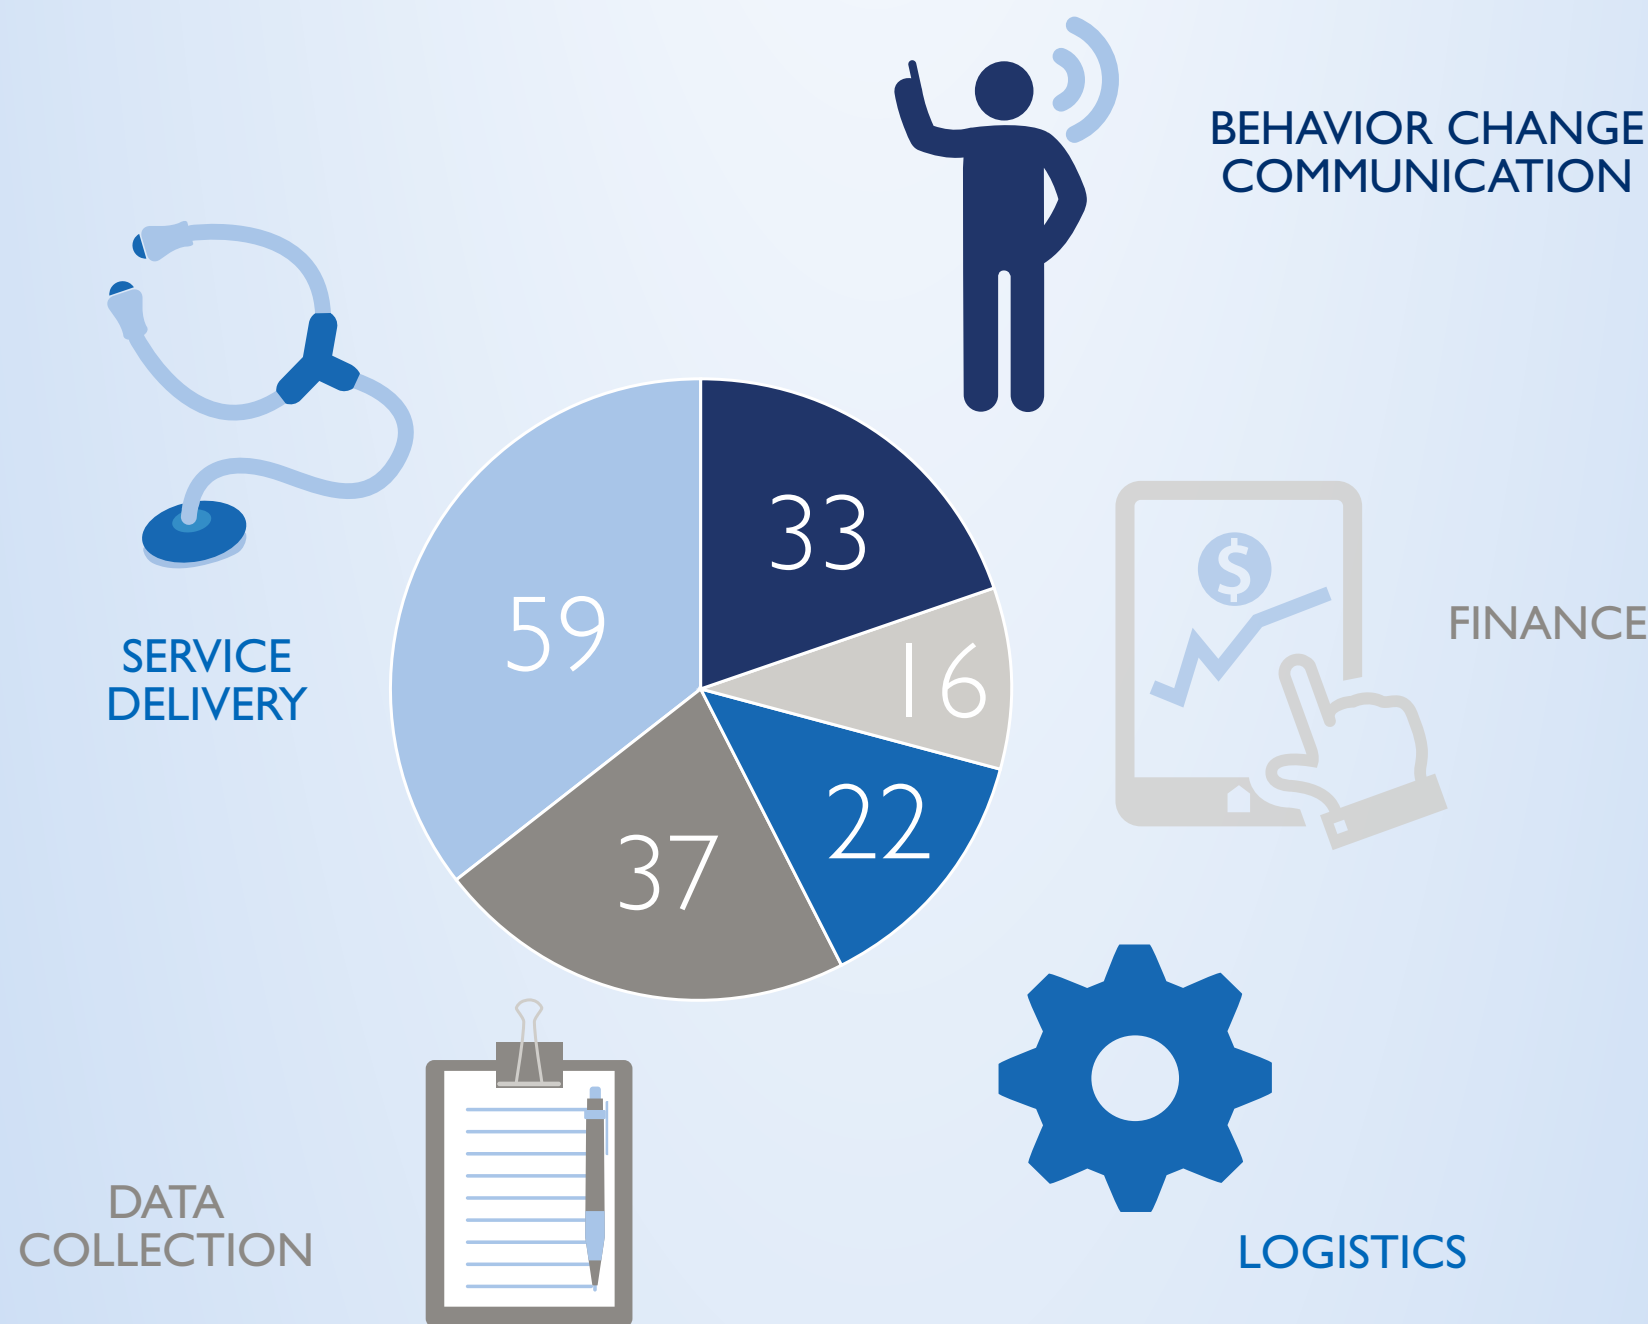

The mHealth Database sorts profiles into searchable categories so users can quickly identify interventions of interest.

Users can search by health area, application type, Compendium category, and geographic location. Select results with application and lessons for five health areas:

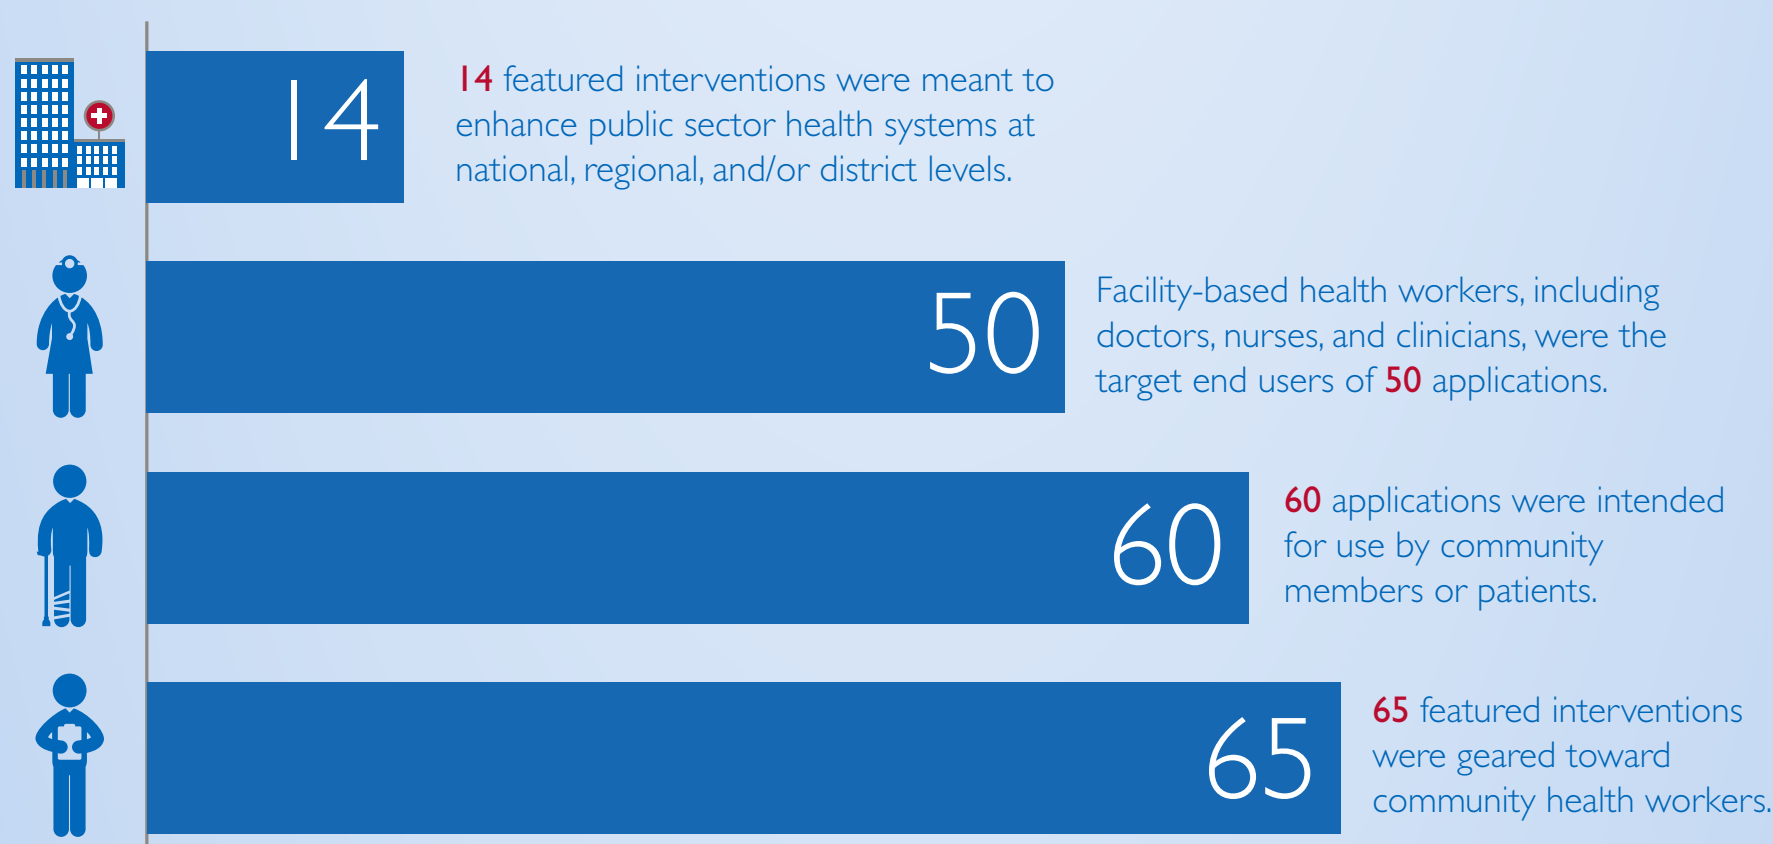

Featured profiles fell into five categories, based on their primary function. See the distribution over the six volumes below.

mHealth applications can be geared toward a variety of primary end users. Below is a selection of end user types across the Compendium.

[Note: some applications are targeted to multiple end users.]
